

What is the function of the water vascular system in echinoderms?

- A. Circulation of blood
- B. Movement and feeding
- C. Excretion
- D. Respiration

Show Answer...

Correct Answer: B) Movement and feeding

Echinoderms:

Echinoderms have a unique water vascular system that uses a network of canals and tube feet to move and feed. Water is taken in through the madreporite, a small opening on the surface of the animal, and is then circulated through the system, which allows the tube feet to extend and contract, enabling movement and feeding. The water vascular system does not function for circulation of blood, excretion or respiration.

Biology MCQs by CSS MCQs

[Biology MCQs by CSSMCQs](#)

Here, you will find all [Biology MCQs](#) with their Answers. These MCQs of Bio would help you gain higher marks in entry tests of FPSC, PPSC, KPPSC, SPSC, NTS, PTS, OTS, CTS, MDCAT, ECAT, ETEA, NUMS and all other entry tests preparation. These MCQs will help you get better marks in every kind of job or university admission tests.

Our focus will be on the fundamental level of the Biology course. However, advance level of Bio main branches Zoology and Botany MCQs will also be shared with their correct answers. For other subject's MCQs Click [HERE](#)
