

Which of the following is not a style tag?

Which of the following is not a style tag?

<div>

<style>

<span>

<link>

Show Answer...

**Correct Answer:** <div>

## Exploring HTML Style Tags: Identifying the Non-Style Tag

**Which of the following is not a style tag?**

HTML provides various tags to structure and style content, but not all tags are directly associated with styling. Let's explore and identify the non-style tag among the given options.

**Answer:**

[<div>](#)

## Understanding Style Tags:

HTML allows the incorporation of style elements to enhance the presentation of web content. While some tags are specifically designed for styling, others serve different purposes.

### 1. <style>:

The <style> tag is a dedicated style tag in HTML used to embed CSS (Cascading Style Sheets) within an HTML document. It plays a crucial role in defining the visual presentation of web pages.

Which of the following is not a style tag?

## 2. **<span>:**

The `<span>` tag is another style-related tag used to apply styles to inline elements. It allows the targeting of specific portions of text within larger blocks for styling purposes.

## 3. **<link>:**

The `<link>` tag, while essential for linking external resources, is not a style tag. It is commonly used to link external CSS files, enabling the application of styles defined in separate style sheets.

## 4. **<div>:**

The `<div>` tag, short for division, is a container tag used for grouping and structuring content. It is not a style-specific tag but serves a fundamental role in organizing elements on a web page.

## Conclusion:

Identifying the non-style tag among the given options reveals that `<div>` is not primarily associated with styling. While it plays a crucial role in structuring content, it doesn't carry the same styling attributes as dedicated style tags like `<style>` or `<span>`.
